

Spotify Music Analytics Dashboard

Business Problem

Music streaming platforms need to understand listener preferences, artist performance, genre popularity, and song characteristics to improve recommendations, increase user engagement, and support content strategy decisions.

Analysis Performed

- Analyzed 114K+ songs and 9,450 artists.
- Evaluated popularity, energy, danceability, and genre distribution.
- Identified top-performing artists and genres.
- Examined relationships between song attributes using scatter plot analysis.
- Analyzed song release trends over time.

Key Insights

- Pop and Hip-Hop dominate the dataset, accounting for the largest share of tracks.
- Most songs fall within the medium popularity range (40–60 popularity score).
- Strong positive relationship observed between energy and danceability.
- Song releases increased significantly after 2010, indicating rapid content growth.
- Taylor Swift, The Weeknd, and Drake are among the top artists by track count.

Business Recommendation

- Prioritize investment in high-performing genres such as Pop and Hip-Hop.
- Improve recommendation algorithms using energy and danceability patterns.
- Promote emerging artists with characteristics similar to top-performing tracks.
- Create personalized playlists based on song attributes and listener behavior.
